Harsh Jain

Junior Python Backend Developer

Delhi, India | +91 8860159116 | harshjain1403@gmail.com | LinkedIn | GitHub | Portfolio

SUMMARY

Recent B.Tech graduate in Computer Science (AI & ML) who enjoys building the backend side of apps. I have built and deployed four Django REST APIs on my own, covering social media, hiring, expenses, and tasks, and I am comfortable with JWT login, MySQL, PostgreSQL, and testing endpoints in Postman. I am looking for a junior Python backend developer role where I can keep learning and start contributing from day one.

SKILLS

Backend: Python, Django, Django REST Framework, REST APIs, JWT Authentication
Databases: MySQL, PostgreSQL, SQL, Django ORM
Tools: Git, GitHub, Postman, Gunicorn, Render, VS Code
Fundamentals: Data Structures & Algorithms, OOP, HTML, CSS

PROJECTS

Social Sphere | Github | Live API

Python, Django REST Framework, MySQL, JWT

- Backend for a social media app where people sign up, log in, and manage their own profile.
- Posts can be text, image, or video, and each user can create, edit, and delete their own.
- Added likes, comments, and follow or unfollow so the API covers how people actually interact.
- Private actions need a valid JWT, so nothing sensitive is open to anonymous requests.
- Designed the MySQL tables and tested the APIs in Postman while building.

Job Portal | Github | Live API

Python, Django REST Framework, MySQL, JWT

- Backend for a job board with two kinds of users: recruiters who post jobs and candidates who browse them.
- Wrote a custom user model so every account carries its role from the moment it registers.
- Only recruiters can create jobs, enforced with a custom permission class rather than checks scattered in views.
- Registration, login, and job listing run on JWT, and the user and job models live in MySQL through the Django ORM.
- Tested each endpoint in Postman, including the cases where a candidate should be turned away.

Expense Tracker API | Github | Live API

Python, Django REST Framework, JWT

- A personal expense API where every user only sees and manages their own spending.
- Full create, read, update, and delete for expenses, with validation and clear error messages on bad input.
- Expenses can be filtered by category, so a client can ask for just one type of spending.
- Every endpoint sits behind JWT login.
- Deployed on Render with a live endpoint anyone can try.

Task Management API | Github | Live API

Python, Django REST Framework, PostgreSQL, Gunicorn

- Task API where each user gets a private task list behind JWT login.
- Tasks can be created, viewed, updated, and deleted, and each one carries a status.
- Tasks can be filtered by status through a query parameter, for example ?status=Completed.
- Runs on PostgreSQL and is served with Gunicorn on Render.
- Task code sits in its own Django app, separate from project settings, so it is easy to extend.

EDUCATION

B.Tech in Computer Science (AI & ML) 2021 to 2025
AKTU University, Lucknow
